

LOGISTIC INNOVATOR

Beams of Light and Development!

Autumn has slowly, but for sure arrived here in Sweden.

We are glad to inform that we have succeeded in larger projects, which have been pending for some time, and that is really positive. These projects have a wide geographical spread from Sweden, Germany, France and Holland. This is a product of the maturity in our European organisation.

Helge Nyberg AB continues to commit to the future by increasing our trolley range and adding new accessories. Our wish is that these will improve our products' appeal!

Even our market presence, via new partners has continued to strengthen, which we also believe will have an effect on the future.

I look forward to future challenges and wish for successful business!

Kind regards
Anders Manfred

THE ERGOBJÖRN TRUCK

Smart Details!

The Ergobjörn truck range provides a cost effective solution for the internal material handling of light goods. It is naturally suitable where efficiency demands motorised transportation and where large trucks and fixed installations are not cost efficient or provide flexible solution.

The concept's basis is that goods are transported using load carriers this reduces the gap between goods handling with manual trolleys and conventional fork lift trucks.

The trucks are flexible and easy to manoeuvre with a design that accommodates Ergobjörn load carriers. The Ergobjörn truck can be used almost everywhere where trolleys are currently used for applications such as: order picking, production/warehouse replenishment, hospitals, transportation within airports etc.

There are many variations of load carriers and we can also provide customised solutions according to specific needs.

Since the total weight of the truck is less than 300 kg, they can also be used on mezzanine floors.

More information on our webpage www.ergobjorn.com

Pick Train Coupling

This coupling design enables the distance between load carriers to be shortened. This provides twice the storage space but with the same manoeuvrability and turning circle as a truck and one load carrier.

A shorter train unit means better ergonomics and an improvement in production efficiency; more orders can be picked, faster.
